

Algoritmo de empresa WineHouse

Repositorio GitHub: <https://github.com/tomassale/SQL.git>

El algoritmo consta de la creación de una base de datos donde se almacena la información cuando el usuario inicia sesión en su cuenta previamente registrada, la cual forma parte de la DB y comienza el proceso de compilación de datos. La empresa junta información, en la que, mediante cookies y el browser reúne los datos de búsqueda, sitios recurrentes o información personal para tener una interfaz más personalizada y adaptada al consumidor. El proceso comienza llenando las tablas de address, personal y account, llevando mediante Primary Keys a la tabla user, la cual también cuenta con una tabla history que registra la Foreign Key de la tabla page. Después de este proceso lleva la información a la tabla data la cual es solicitada por las empresas siendo registradas en la tabla company.

Tabla para logs de usuarios en la db

logs(T.D.)		
id_logs (PK)	id logs	INT
table_logs	tabla	VARCHAR(20)
dml	sentencia	VARCHAR(20)
registered_logs	fecha	DATETIME
user	usuario	VARCHAR(50)
db	bd	VARCHAR(20)
version	version	VARCHAR(20)

Tabla para datos guardados de usuario

user(T.H.)		
id_user (PK)	id usuario	INT
user_mail (FK)	mail	VARCHAR(50)
id_personal (FK)	id personal	INT
ip_user (FK)	ip	VARCHAR(20)
id_history (FK)	id historial	INT

Tabla para datos personales de usuario

personal (T.D.)		
id_personal (PK)	id personal	INT
gender	genero	VARCHAR(10)
user_first_name	nombre	VARCHAR(20)
user_last_name	apellido	VARCHAR(30)
age	edad	INT

Tabla para cuenta de usuario

account (T.D.)		
user_mail (PK)	mail	VARCHAR(50)
user_password	contraseña	VARCHAR(50)
register_account	fecha registro	DATETIME

Tabla para direccion de usuario

address (T.D.)		
ip_user (PK)	ip	VARCHAR(20)
country_code	codigo pais	VARCHAR(10)
city	ciudad	VARCHAR(50)
street	calle	VARCHAR(60)

Tabla para historial de usuario

history (T.D.)		
id_history (PK)	id historial	INT
person_history	historial pers.	INT
name_page (FK)	nombre pag.	VARCHAR(50)

Tabla para paginas

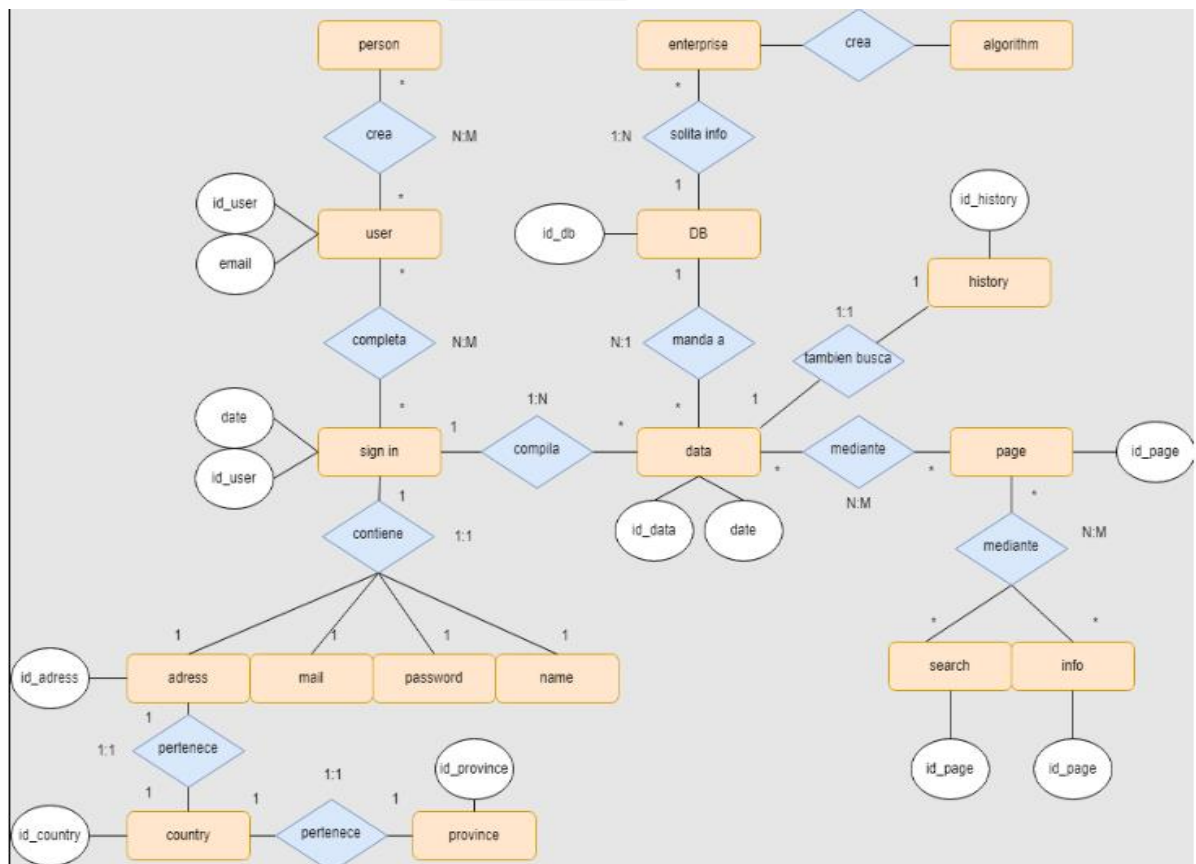

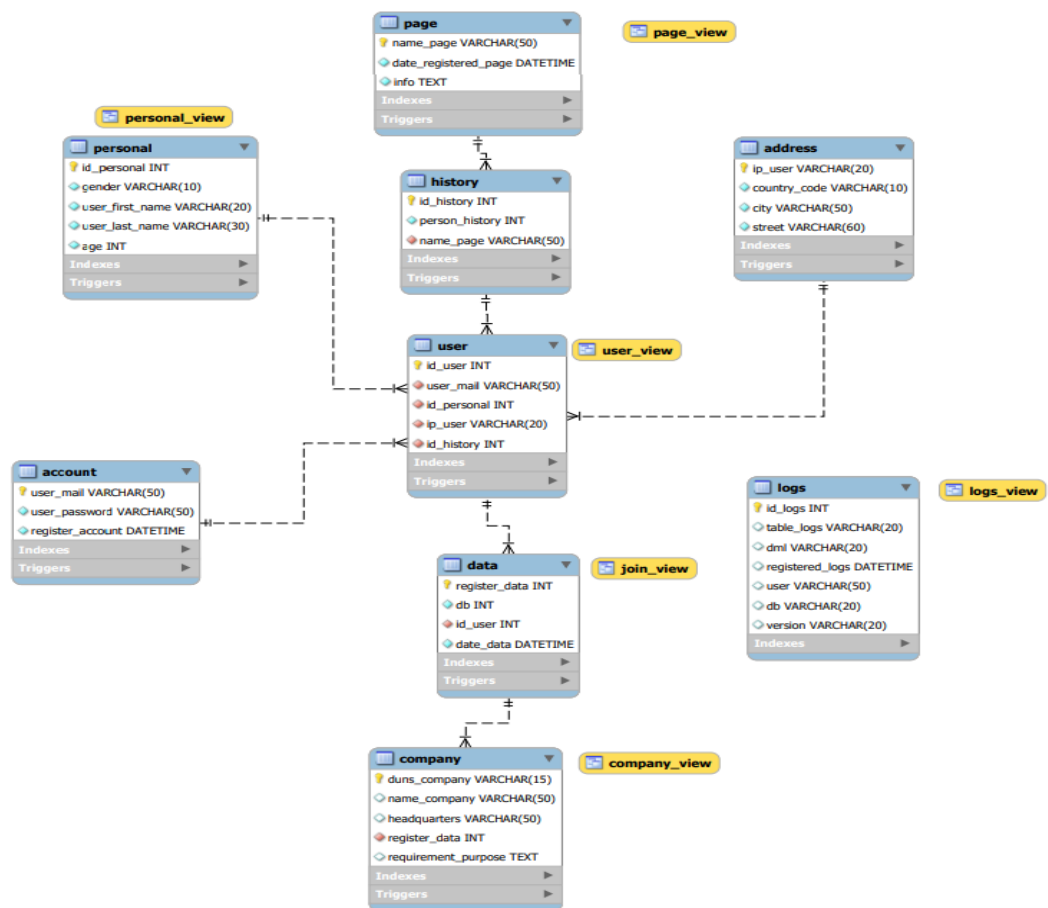

page (T.D.)		
name_page (PK)	nombre pag.	VARCHAR(50)
date_registered_page	fecha registrada	DATETIME
info	descripcion	TEXT

Tabla para datos guardados

data (T.H.)		
register_data (PK)	id data	INT
db	bd	INT
id_user (FK)	id usuario	INT
date_data	fecha data	DATETIME

Tabla para las empresas

company (T.D.)		
duns_company (PK)	duns empresa	VARCHAR(15)
name_company	nombre	VARCHAR(50)
headquarters	sede central	VARCHAR(50)
register_data (FK)	id data	INT
requirement_purpose	requerimiento	TEXT

Vistas

1- Vista que trae id registros. registros de tablas, sentencia dml y fecha del registro de la tabla logs.

```
CREATE OR REPLACE VIEW logs_view as
SELECT id_logs, table_logs, dml, registered_logs, user
FROM logs;
```

	id_logs	table_logs	dml	registered_logs	user
►	1	personal	Insert	2022-07-19 14:40:02	root@localhost
	2	personal	Insert	2022-07-19 14:40:02	root@localhost
	3	personal	Insert	2022-07-19 14:40:02	root@localhost
	4	personal	Insert	2022-07-19 14:40:02	root@localhost
	5	personal	Insert	2022-07-19 14:40:02	root@localhost
	6	personal	Insert	2022-07-19 14:40:02	root@localhost
	7	personal	Insert	2022-07-19 14:40:02	root@localhost
	8	personal	Insert	2022-07-19 14:40:02	root@localhost
	9	personal	Insert	2022-07-19 14:40:02	root@localhost
	10	personal	Insert	2022-07-19 14:40:02	root@localhost

2- Vista que trae id del usuario, mail, id personal, ip y el id de historial de la tabla user.

```
CREATE OR REPLACE VIEW user_view as
SELECT *
FROM user;
```

	id_user	user_mail	id_personal	ip_user	id_history

2. Se selecciona la tabla previamente creada a la que se importaran los datos

3. En la barra superior se selección la herramienta de importación

4. Se selecciona el archivo a importar y se presiona next

The screenshot shows the 'Table Data Import' dialog box with the title bar 'Table Data Import'. The main heading is 'Select File to Import'. Below it, a text box explains: 'Table Data Import allows you to easily import CSV, JSON datafiles. You can also create destination table on the fly.' A 'File Path:' label is followed by a text input field containing 'E:\PRACTICA\CODERHOUSE\SQL\SQL files\csv\account.csv' and a 'Browse...' button. At the bottom right, there are three buttons: '< Back', 'Next >', and 'Cancel'.

5. Se selecciona en que tabla se desea importar o se crea si es inexistente y se presiona next

The screenshot shows the 'Table Data Import' dialog box with the title bar 'Table Data Import'. The main heading is 'Select Destination'. Below it, a text box explains: 'Select destination table and additional options.' There are three radio button options: 'Use existing table:' (selected) with a dropdown menu showing 'db_winehouse.account'; 'Create new table:' with a dropdown menu showing 'db_winehous' and a text input field containing 'address'; and 'Truncate table before import' (unchecked). At the bottom right, there are three buttons: '< Back', 'Next >', and 'Cancel'.

6. Aquí veremos una previsualización de los datos y se puede seleccionar si alguno no se importa. Se presiona nuevamente next

7. Nuevamente next para confirmar la importación.

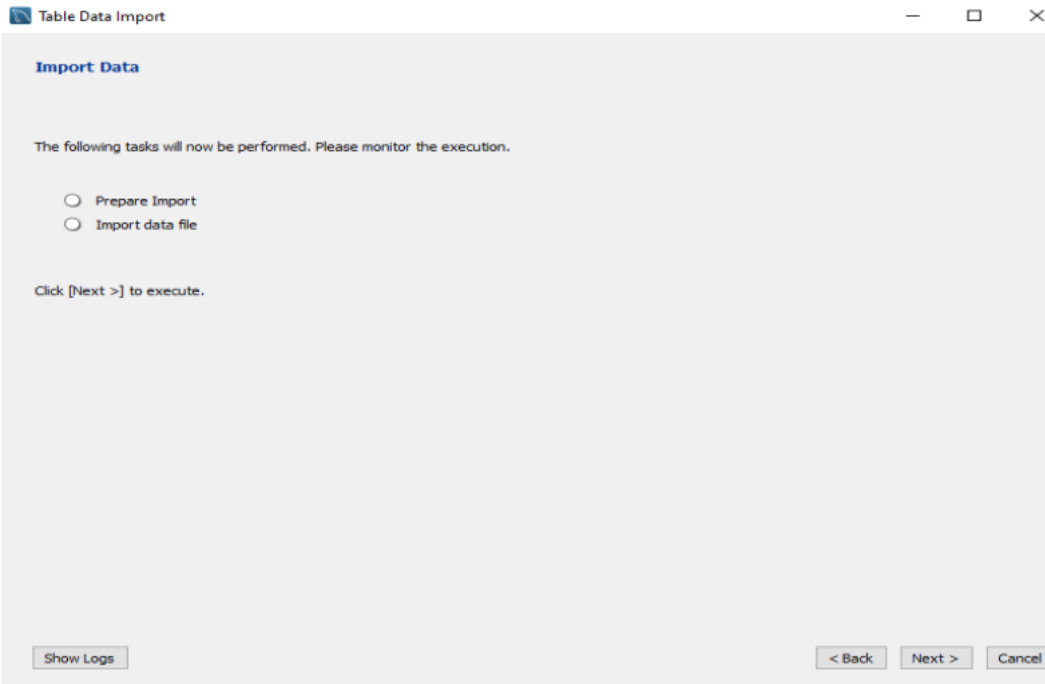

Table Data Import

Import Data

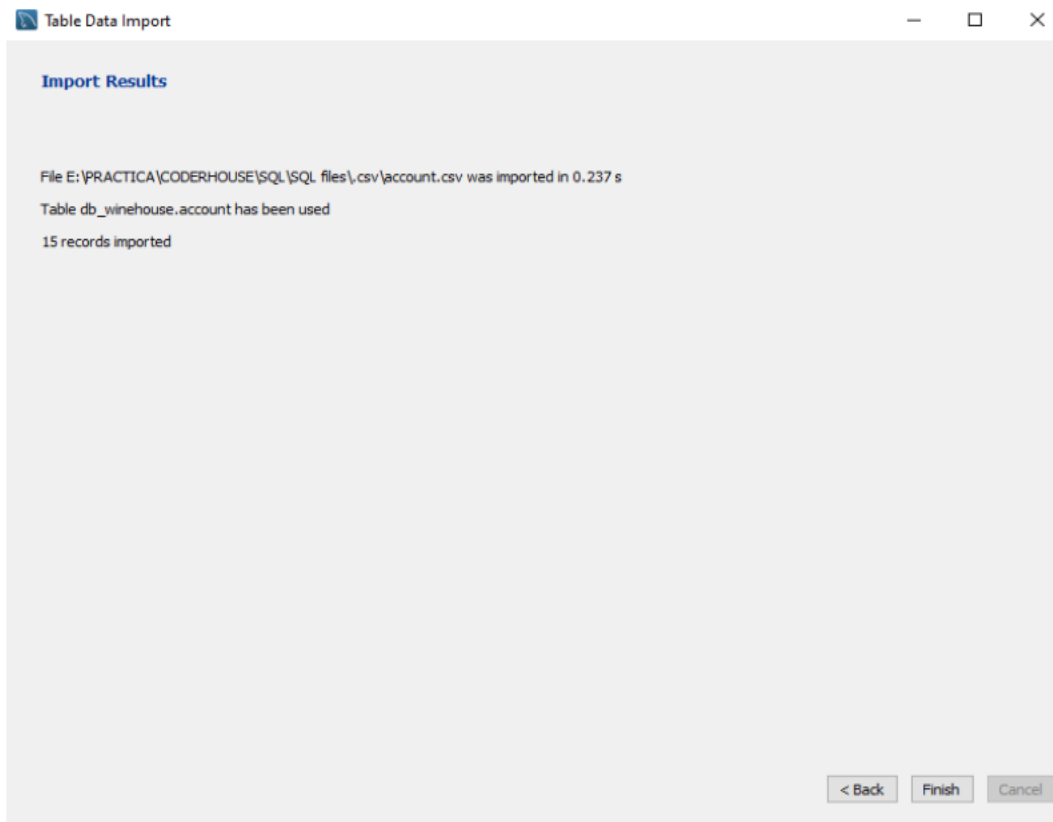

The following tasks will now be performed. Please monitor the execution.

- ☐ Prepare Import
- ☐ Import data file

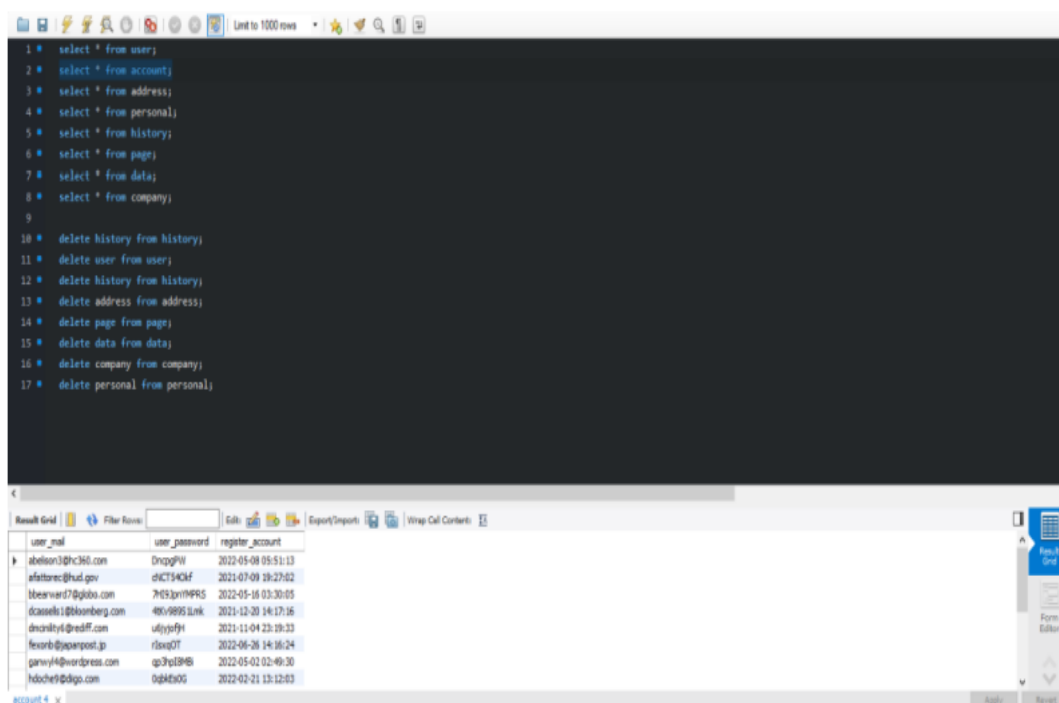

Click [Next >] to execute.

Show Logs

< Back Next > Cancel

Presionamos finish y visualizamos los datos importados en MySQL Workbench

Funciones

1-Función buscadora de id mediante parámetros de nombre (name) y apellido (last_name) en tabla user

```
DROP FUNCTION IF EXISTS `user_id`;
DELIMITER $$
CREATE FUNCTION `user_id`(name VARCHAR(20), last_name VARCHAR(20)) RETURNS VARCHAR(50)
READS SQL DATA
BEGIN
    DECLARE id_u VARCHAR(50);
    SET id_u = (SELECT id_personal FROM personal WHERE
                user_first_name IN (SELECT user_first_name FROM personal WHERE user_first_name = name)
                AND
                user_last_name IN (SELECT user_last_name FROM personal WHERE user_last_name = last_name)
    );
    IF isnull(id_u) THEN
        RETURN CONCAT('Nombre o apellido invalido');
    ELSE
        RETURN CONCAT('ID usuario: ',id_u);
    END IF;
END$$
```

2- Función buscadora de duns por parámetro de nombre de la empresa (name) en la tabla

```
DROP FUNCTION IF EXISTS `company_duns`;
DELIMITER $$
CREATE FUNCTION `company_duns`(name VARCHAR(20)) RETURNS VARCHAR(50)
READS SQL DATA
BEGIN
    DECLARE duns_c VARCHAR(50);
    SET duns_c = (SELECT duns_company FROM company WHERE
                name_company IN (SELECT name_company FROM company WHERE name_company = name)
    );
    IF isnull(duns_c) THEN
        RETURN CONCAT('Nombre invalido');
    ELSE
        RETURN CONCAT('duns empresa: ',duns_c);
    END IF;
END$$
```

3- Función trae descripción de página por parámetro de nombre de la tabla (name) page.

```
DROP FUNCTION IF EXISTS `page_info`;
DELIMITER $$
CREATE FUNCTION `page_info`(name VARCHAR(20)) RETURNS TEXT
READS SQL DATA
BEGIN
    DECLARE info_p TEXT;
    SET info_p = (SELECT info FROM page WHERE
                  name_page IN (SELECT name_page FROM page WHERE name_page = name)
    );
    IF isnull(info_p) THEN
        RETURN CONCAT('Nombre invalido');
    ELSE
        RETURN CONCAT('Descripcion empresa: ',info_p);
    END IF;
END$$
```

4- Función trae a que db está vinculada la cuenta por parámetro de id del usuario (id_u) de la tabla data.

```
DROP FUNCTION IF EXISTS `data_db`;
DELIMITER $$
CREATE FUNCTION `data_db`(id_u INT) RETURNS VARCHAR(50)
READS SQL DATA
BEGIN
    DECLARE db_d INT;
    SET db_d = (SELECT db FROM data WHERE
                id_user IN (SELECT id_user FROM user WHERE id_user = id_u)
    );
    IF isnull(db_d) THEN
        RETURN CONCAT('Id invalido');
    ELSE
        RETURN CONCAT('Base de datos: ', db_d);
    END IF;
END$$
```

5- Función trae cantidad de sentencias ejecutada por el usuario mediante parámetro de nombre de usuario (p_user), sentencia (p_dml) y tabla (p_table_logs) de la tabla logs.

```
DROP FUNCTION IF EXISTS `logs_id`;
DELIMITER $$
CREATE FUNCTION `logs_id`(p_user VARCHAR(50), p_dml VARCHAR(20), p_table_logs VARCHAR(20)) RETURNS VARCHAR(50)
READS SQL DATA
BEGIN
    DECLARE id_1 INT;
    SET id_1 = (SELECT COUNT(id_logs) FROM logs WHERE
                user IN (SELECT user FROM logs WHERE user = p_user)
                AND
                dml IN (SELECT dml FROM logs WHERE dml = p_dml)
                AND
                table_logs IN (SELECT table_logs FROM logs WHERE table_logs = p_table_logs)
                );
    IF isnull(id_1) THEN
        RETURN CONCAT('User, sentencia o tabla invalido');
    ELSE
        RETURN CONCAT('Cantidad de movimientos: ', id_1);
    END IF;
END$$
```

Stored Procedure

*Procedimiento almacenado para traer una fila ordenada de la tabla recibida por parámetro (p_table), el campo recibido por parámetro (p_field) y en el orden recibido de la misma forma (p_ord).

```
